

Quiz 1

02/27 : in class

more details next lecture

• Stationarity.

△ strict stationarity

All finite dimensional distributions are invariant w.r.t. time shift.

△ (weak) stationarity

(1) $\mu(t) = \text{constant}$.

(2) $\gamma(s, t) = \gamma(s + \delta, t + \delta)$

↳ Univariate autocovariance function:

$$\gamma(h) = \gamma(t+h, t)$$

↑
lag variable

Warning: one can use the univariate $\gamma(h)$ only after confirming weak stationarity.
